Hi Paul,

I want to have an informal build with this ROM checksum enabled, I have updated the necessary files in Integrity and trigger the build in Jenkins, but it seems Jenkins cannot take the latest file in Integrity, do you know why?

The files Jenkins checked out:

```
8968.  checked out revision 1.1 - security.dll
8969.  checked out revision 1.21 - CANape.ini
8970.  checked out revision 1.21 - HKMC_SK.cna
8971.  checked out revision 1.6 - 3030_HKMC_SK_Fault_List.xlsx
8972.  checked out revision 1.4 - HKMC_SK_Software_Reflash_Instruction.doc
8973.  checked out revision 1.33 - .cproject
8974.  checked out revision 1.1 - .project
8975.  checked out revision 1.13 - build.gradle
8976.  checked out revision 1.1 - gradle.bat
8977.  checked out revision 1.29 - gradle.properties
8978.  checked out revision 1.3 - settings.gradle
```

The files in Integrity:

```
01-Development\project.pj
    V00-Mainline\project.pj
        01-Configuration\project.pj
        02-Requirements\project.pj
        03-Model\project.pj
        04-Components\project.pj
        05-IntegrationTest\project.pj
        06-SubAssemblies\project.pj
        09-Build\project.pj
        10-Resources\project.pj
            CANalyzer\project.pj (1.1.1.5)
            CANape\project.pj
            FaultList\project.pj
            Reflash\project.pj
            .cproject                          1.34
            .project                           1.1
            build.gradle                       1.14
            gradle.bat                         1.1
            gradle.properties                  1.29
            settings.gradle                    1.3
```
